THE FACTS: Florida

Public Health Funding: Strong investments in public health allow a state to carry out programs that improve health. Florida receives $21.82 per person in funding from CDC (33rd in the nation) and $23.04 per person from HRSA (41st in the nation). The Prevention and Public Health Fund has awarded over $110 million in grants to Florida since 2010 for community and clinical prevention efforts and improvements to public health infrastructure.

Access to Care: 12.5 percent of people in Florida do not have health insurance coverage compared to the national uninsured rate of 8.6 percent. The number of practicing primary care physicians is also an important measure of health care availability. Florida has 131.6 active primary care physicians per 100,000 people. Nationally, there are 149.7 practicing primary care physicians per 100,000 people.

Notable Health Measures
- Air pollution: 6.8 micrograms of fine particles per cubic meter, ranking the state 13th lowest in air pollution in the nation. Reduced exposure to air pollution is important to as poor air quality leads to reduced lung function, increased risk of asthma complications, heart attacks, heart failure and death, and impacts a large number of people, particularly impacting young children and older adults.
- Cardiovascular deaths: 229 cardiovascular deaths per 100,000 people which places the rate of cardiovascular deaths in Florida below the national average of 254.6 deaths per 100,000 people.
- Drug deaths: As drug deaths continue to increase in many states across the nation, Florida has been successful in driving down the number of deaths due to drug injury. In Florida, drug deaths decreased 19 percent from 17.4 deaths per 100,000 people in 2012 to 14.1 deaths per 100,000 people in 2017.

The Challenges Ahead
- High school graduation: 77.9 percent of students graduate high school in Florida, the 9th lowest graduation rate in the nation. This is of public health concern as there is a strong connection between education and health. People with higher levels of education are more likely to adopt healthy behaviors. The health benefits of educational attainment accumulate and as a result will also impact the community level and social/cultural context.
- Children in poverty: 18.7 percent of children in Florida live in a household below the poverty line. This places Florida 32nd in the nation. Poverty has been linked to higher rates of chronic diseases and shorter life expectancy.
