THE FACTS:  
Georgia

Public Health Funding: Strong investments in public health allow a state to carry out programs that improve health. Georgia receives $26.32 per person in funding from CDC (17th in the nation) and $26.02 per person from HRSA (32nd in the nation). The Prevention and Public Health Fund has awarded over $128 million in grants to Georgia since 2010 for community and clinical prevention efforts and improvements to public health infrastructure.

Access to Care: 12.9 percent of people in Georgia do not have health insurance coverage compared to the national uninsured rate of 8.6 percent. The number of practicing primary care physicians is also an important measure of health care availability. Georgia has 119.9 active primary care physicians per 100,000 people, ranking well below the national average of 149.7 practicing primary care physicians per 100,000 people.

Notable Health Measures
- **Infectious disease:** Georgia has high rates of Salmonella (21.1 cases per 100,000 people; 12th highest in the nation) and chlamydia (570.8 cases per 100,000 people; 6th highest in the nation).
- **Obesity:** Obesity contributes to poor general health and is a leading factor in preventable diseases. The obesity rate has steadily increased over the decades with 31.4 percent of the adult population in Georgia obese.

The Challenges Ahead
- **Low birthweight:** In Georgia, 9.5 percent of live births have a low birthweight, the 6th highest in the nation. Low birthweight is associated with short- and long-term complications and an increased risk of infant mortality.
- **Infant mortality:** In the past two years, infant mortality increased 15 percent from 6.6 to 7.6 deaths per 1,000 live births. The state now has the 6th highest infant mortality rate in the nation.
- **Children in poverty:** Georgia ranks 46th in the nation, with 23.2 percent of children living below the poverty line. Poverty has been linked to higher rates of chronic diseases and shorter life expectancy. Additionally, children born into poverty are more likely than other children to die within the first month after birth.
