

THE FACTS ARIZONA

Speak
for **Health**

AN INITIATIVE OF THE
AMERICAN PUBLIC HEALTH ASSOCIATION

PUBLIC HEALTH FUNDING Strong investments in public health allow a state to carry out programs that improve health. Arizona receives \$84 per person from the Centers for Disease Control and Prevention and the Health Resources Services Administration in public health funding. In fiscal year 2023, the Prevention and Public Health Fund awarded the state \$6.83 million in grants for community and clinical prevention efforts and improvements to public health infrastructure.

ACCESS TO CARE 9.9 percent of people in Arizona do not have health insurance coverage compared to the national uninsured rate of 7.9 percent. The number of practicing primary care providers is also an important measure of health care availability. Arizona has 258.2 active primary care providers per 100,000 people. Nationally, there are 283.4 practicing primary care providers per 100,000 people.

Notable Health Measures

- **Lead Risk** 6.3 percent of houses in Arizona are at risk for lead exposure, making the state 2nd lowest in the nation. There are no known safe levels of lead exposure, and the American Healthy Homes survey estimated that 93% of homes built before 1978 have lead paint in them.
- **Chlamydia** The state reports 554.4 new chlamydia cases per 100,000 population, ranking 11th highest in the nation.
- **Air pollution** The state reports an average exposure of 10.5 micrograms of fine particles per cubic meter, ranking the state 12th highest in air pollution in the nation. Poor air quality can have severe health effects and impact a large number of people, particularly impacting young children and older adults.

The Challenges Ahead

- **High school graduation** 77.3% of students graduate from high school, ranking lowest in the nation, which is of public health concern given that individuals with higher levels of education are more likely to adopt healthy behaviors.
- **Drug deaths** Arizona has a rate of 36.2 deaths due to drug overdose per 100,000 people, ranking the state 33rd highest in the nation. Additionally, opioids have had a significant impact on Arizona's medical care system due to the volume and cost of hospital admission and emergency department use.
